

POINT Code Releases

Rationale and Plans

Version 1.0 / 31.01.2016

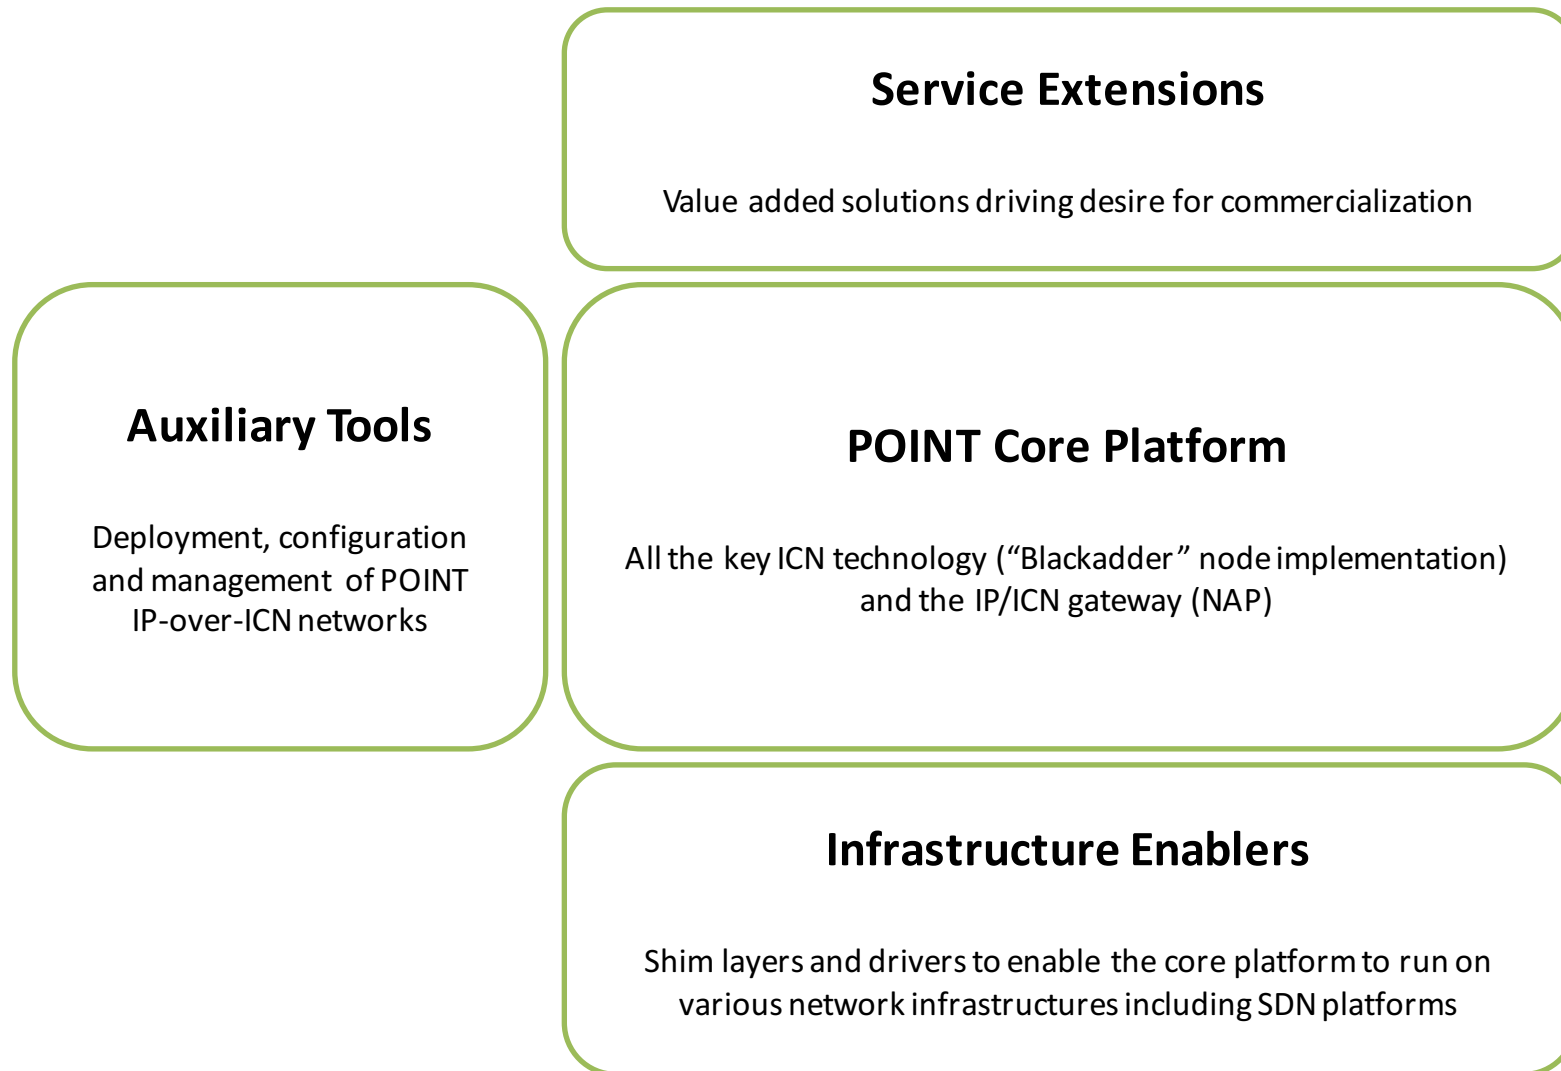

Motivation and Objectives

- After more than a year of design and development, the H2020 POINT project is performing its first code release
- This document outlines our plan and objectives for current and subsequent releases, placing them in the context of our overall exploitation roadmap
- In brief, we target for **self-contained, well tested, and thoroughly documented** open source code for our core platform and selected support tools especially to aid in our standardization push

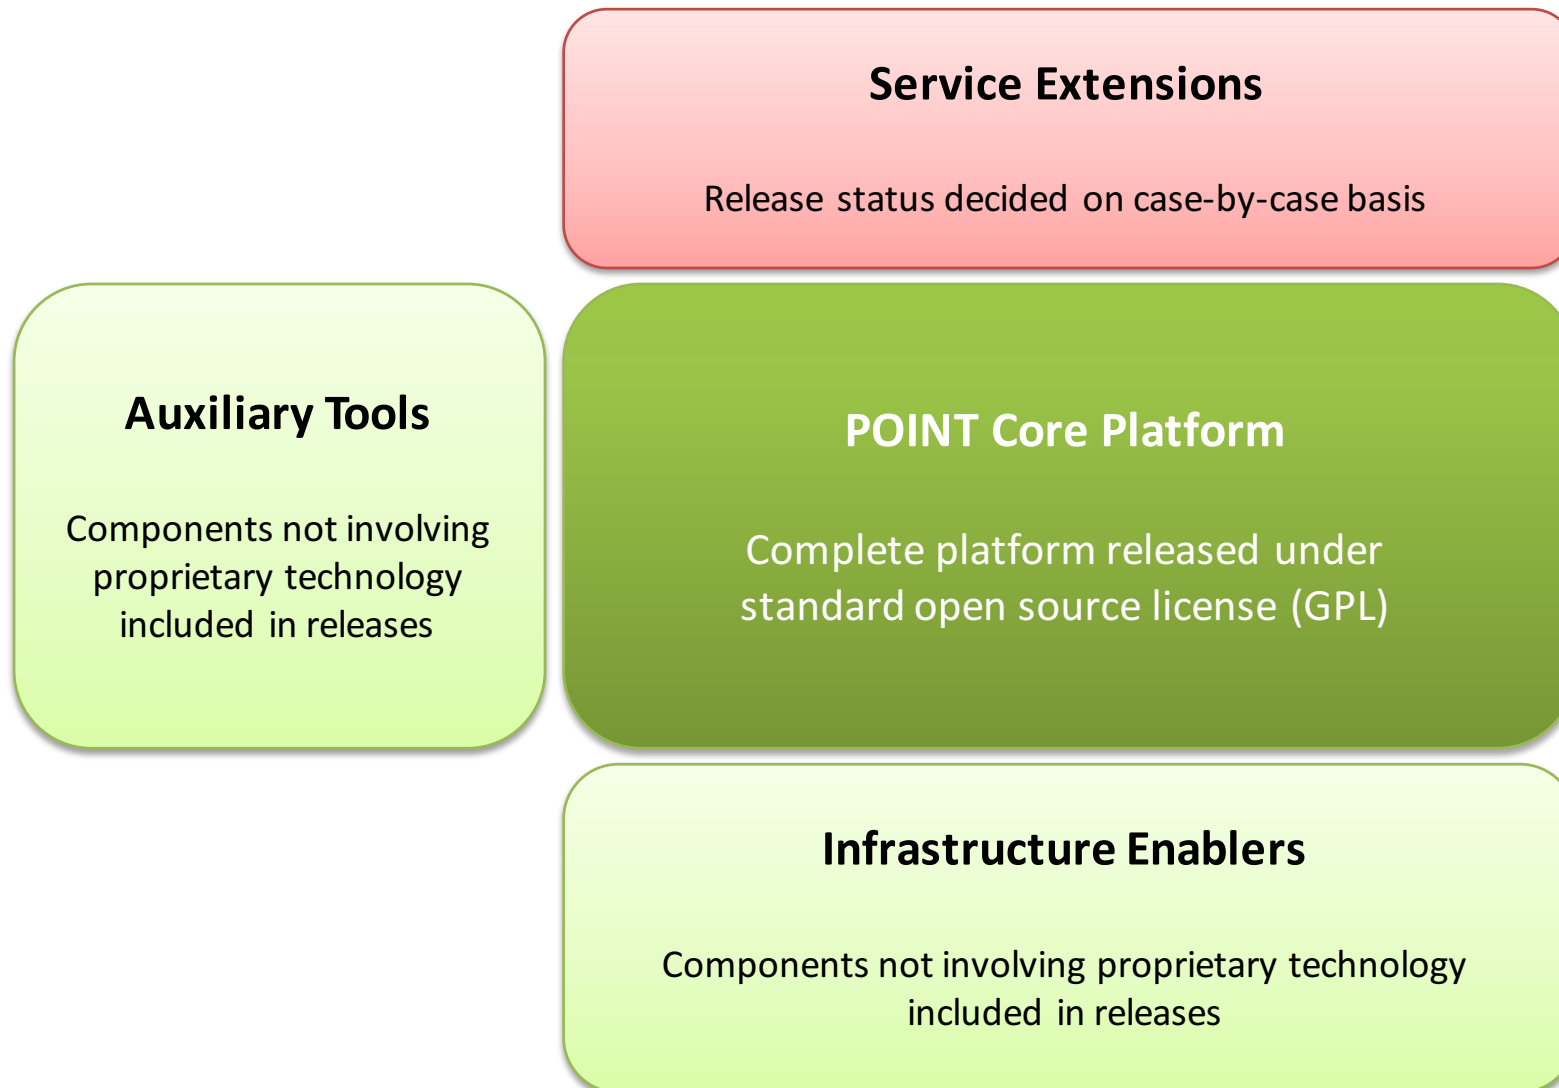

Maximizing Exploitation Opportunities

- The main objective for our code release strategy is to obtain best possible exploitation outcome for the project as a whole
- Our strong push towards standardization esp. in IETF is facilitated by providing mature open source releases of our complete core platform
 - Enables key stakeholders to experiment with our architecture and solutions, especially helping in standardization of relevant interfaces
 - Also streamlines organizing external R&D collaborations
- Selected components built on this platform remain closed, with the corresponding IPR having commercial value especially for industrial partners

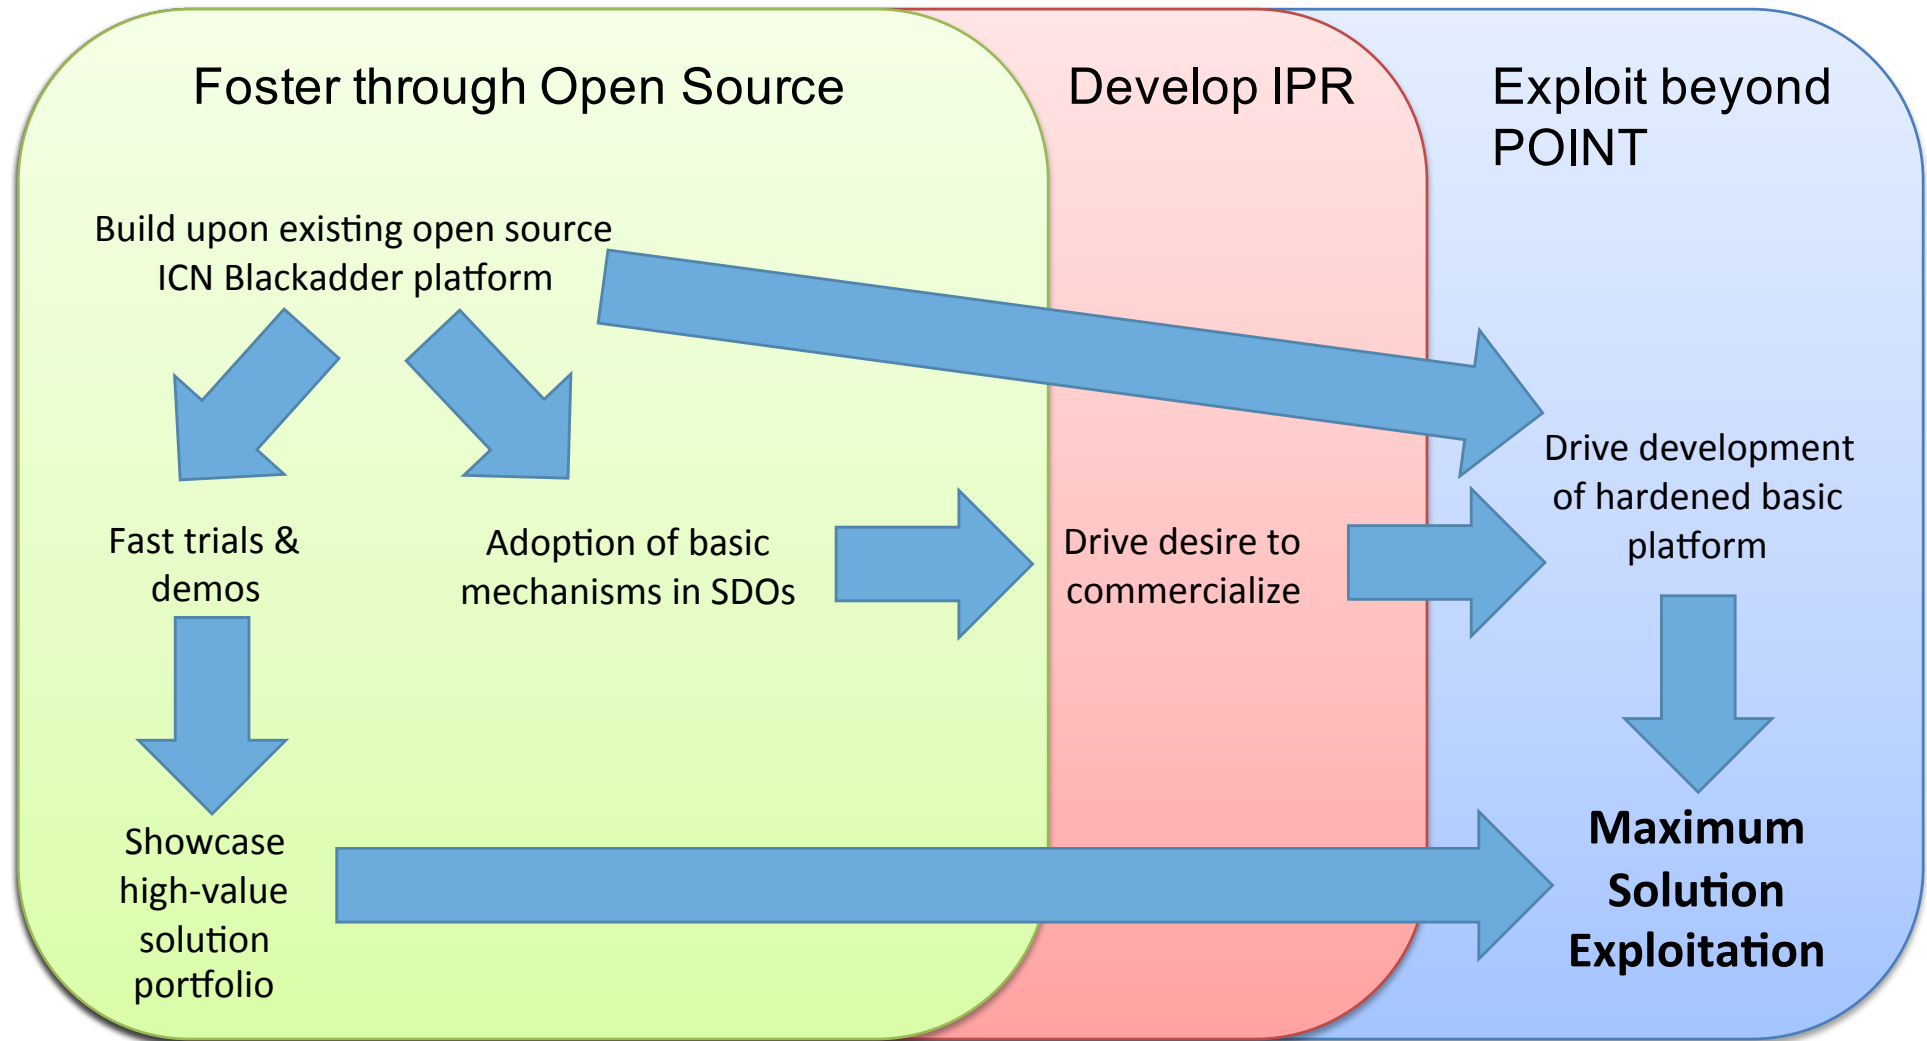

Major POINT Software Packages

Release Plan

Exploitation Roadmap

Summary

- We will release **self-contained, well tested, and thoroughly documented** open source code of our core platform and selected support tools as key part of exploitation plan
- Objective to foster **technology uptake** and **standardization**
- Simultaneously enable **IPR protection** of value added solutions developed within the project for subsequent commercialization
- Strong aim for **maximum exploitation outcome** from project
